Results of the Labour Force Survey 2019.....	11

Introduction

The Labour Force Survey (LFS) was conducted in September and October 2019. The Labour Force Survey is a survey aimed to measure the unemployment rate at the time of data collection. The fieldwork was initially conducted for six weeks in which a sample of 2,650 households were approached. However, due to declining participation, it was extended for another two weeks in which the soft refusals and those who were not at home were re-approached.

The resulting statistic is a snapshot of the balance between the employed and unemployed (15 years and older) population on Curaçao. The LFS seeks to understand the working population and the supply side of the labour market. The information supplied by those in the sample answer the question of education and composition of the labour force.

The year 2019 was a turbulent year for Curaçao where it had to contend with many foreclosures and liquidations resulting in loss of employment. This is characterized by the numbers from the Chamber of Commerce (Figure 1) that show an increase in closures.

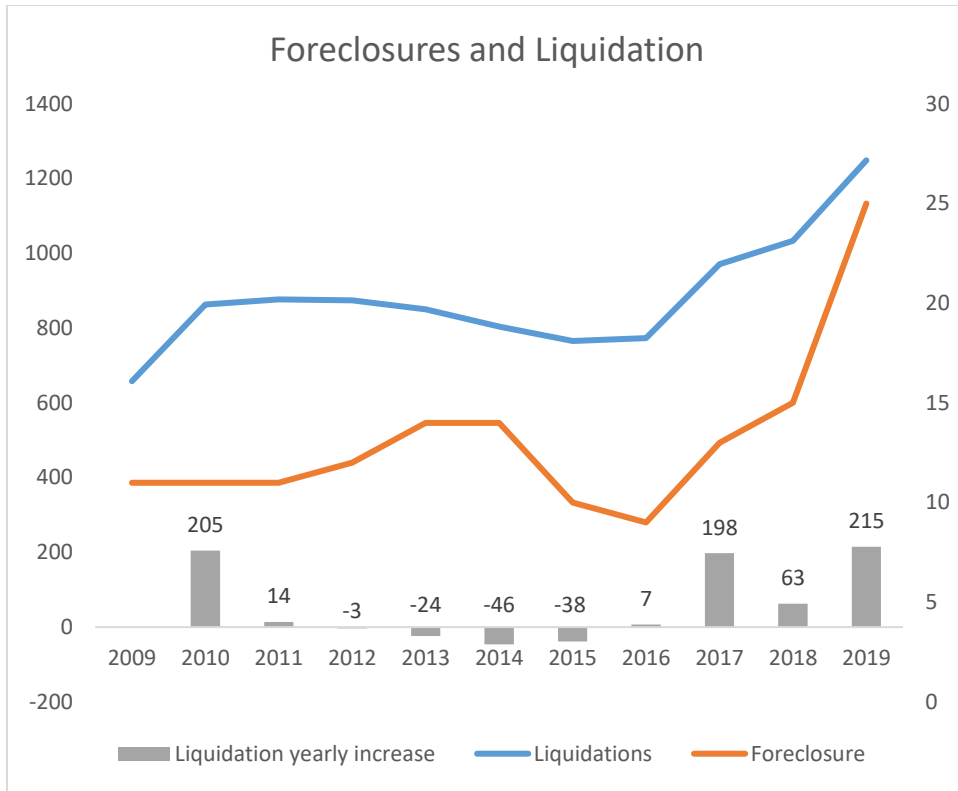

Figure 1 Foreclosures and Liquidations 2009- 2019

A monthly breakdown of all closed business, according to the Chamber of Commerce, shows that the between September 2018 and April 2019 there were more closures than the period between May 2019 and September 2019.

Of all the new registrations, past numbers show that between 15% and 35% actually turn into active businesses. Figure 2 thus shows that there are more closures than new active registrations.

Figure 2 Number of closures 2018/09 to 2019/09 Chamber of Commerce Curaçao

Table 1 shows the average number of employees per business type based on the business registry and the National Accounts survey from the CBS. Applying the average number of employees by business type, we can estimate that an additional 6,971 people lost employment between September 2018 and September 2019.

Business Type	Average number of employees	Calculated number of employees laid off
N.V.	7	1,764
B.V.	7.1	1,945
Sole proprietorship	1.0	1,364
Foundation	11.4	1,140
Other	5.7	758
Total calculated employees laid off		6,971

Table 1 Average number of laid off employees

These numbers are also corroborated through the department of labour and social affairs. In 2019, one can see a significant higher amount of people who have indicated that they have been dismissed. According to the number seen in figure 2, the majority is concentrated in the second quarter.

Figure 3 Dismissal Requests 2018-2019 Department of Labour and Social Affairs

Summary

Between September 2018 and September 2019, the labour market of Curaçao has gone through many changes. All of these changes fueled by loss of employment across the country. The unemployment rate went from 13.4 to 17.4 with a peak of 21.3 in April 2019.

Business closures, especially within big companies have resulted in higher number of unemployment. Higher unemployment resulted in movements within the employment categories. Those who were previously classified as economically inactive, have become active jobseekers as a decreasing economy warrants a higher need for an income.

Two important groups who are always indicative of a tumultuous labour market are the youth (15-24 year-old) and the pensioners (65 and older). The unemployment of these two groups have increased significantly between 2018 and 2019. The unemployed youth have nearly doubled in size, while there is also movement in the 65 and older age group as they are either re-entering the labour market or staying in the labour market and are actively seeking more employment.

Methodology

Sample: The sample for the LFS consisted of 2,650 households. This number has been calculated with oversampling due to the increasing non-response rate and with the confidence interval of 95%. The sampling frame is based on the building point inventory exercise conducted by the Central Bureau of Statistics (CBS) in 2017. The sample excludes households that have already been contacted for other household surveys in 2019 and the 2018 LFS survey.

Fieldwork: The sample was divided among 29 interviewers. The interviewers are always trained on the questionnaire, technical aspects and communication skills. Each interviewer conducted their interviews on a tablet. One of the advantages of using the tablet is the speed at which the data is received and thus can be corrected if needed.

Non-response: A household is classified as a non-response for different reasons including hard refusal, when no one is at home, when the address is uninhabited or a business. The non-response rate for the 2019 LFS was 32.5%. This was 35.6% and 37.3% for 2018 and 2017 respectively. After the initial fieldwork period, the non-response was 47.8%.

Confidence interval and reliability: Surveys can be conducted as sample surveys or population surveys. A population survey is when all the elements of the populations are approached and interviewed. The census is a good example of a population survey. A sample survey is when a representative portion of the population is approached. This sample has to be big enough that the results reflect the patterns in the populations. This size is determined taking into consideration the size of the population and the reliability with which the results will be reported. The theory behind is that the more people you approach, eventually answers and patterns can be predicted within a reasonable interval so that not all persons need to be interviewed. Oftentimes one will not have the time or finances to interview everyone in the population. This reasonable interval is called the confidence interval. Each statistic based on sample surveys thus have an error margin associated with it. Acceptable error margins are 2% or less. The LFS sample has an error margin of 1.94%.

The 2019 LFS yielded an unemployment rate of 17.4%. This particular statistic has an error margin of 1.61%. In layman terms, this means that the actual unemployment rate is between 15.8% and 19.0%.

Definitions:

The definitions used in the LFS are based on the KILM and the local labour market situation. Accordingly, individuals 15 years and older were classified in one of the three categories of the labour market (labour status): employed, unemployed, or economically not active. The definitions are given in this paragraph.

Employed

All persons of 15 years and older who during the research period:

- a. had a job or have their own business; or
- b. who during the week preceding the research period performed any work for pay in cash or in kind, for 4 hours or more.

Unemployed

All persons of 15 years and older who during the research period:

- a. did not have a job or a business of their own; and
- b. had actively been seeking work in the preceding month of the research period; and
- c. who were available to start working or start a business within two weeks.

Economically not active

All persons of 15 years and older who during the research period:

- a. did not have a job or own a business; and
- b. who were not actively seeking work.

This group consists of mostly students, housewives or househusbands and pensioners who are not working or looking for a job.

Labour force

The total number of persons who are employed added to the total number of persons who are unemployed.

Unemployment rate

The number of unemployed persons as a percentage of the labour force (employed and not employed). The economically inactive group is not counted in this calculation.

Youth unemployment rate

The unemployment rate in the age category of 15–24 years.

Participation rate

The number of persons in the labour force as a percentage of the total population.

Labour Force participation rate

The number of persons in the labour force as a percentage of the working age population.

Underemployment

The percentage of employed people who are employed and are seeking or are available for additional work during the reference period.

Results of the Labour Force Survey 2019

The labour force of Cuacao increased in 2019 with approximately 6.3 percent (Table 2). This increase is largely due to an increase of more than 3,500 unemployed people between September 2018 and September 2019. The employed population increased by more than 800 people.

Table 2 Labour force Curaçao 2014-2019

The economically inactive population decreased by 5,786 people. Looking at the number it shows a clear flow from being economically inactive to employ. The difference between these two groups according to the international definition is that the former is not actively looking for work. In 2019, besides the foreclosures and liquidations, a portion of those who were previously not actively looking for work has started looking for work, thus increasing the number of unemployed.

Table 5 Labour force Curaçao 2014-2019 (15-24 years)

The unemployment rate for the youth (15-24 year old) has increased from 29.3 to 41.7. This group includes students who have indicated that while going to school they are also looking for work. These students are also included in the unemployed per the definition of unemployment; unemployed are those who have indicated that they are actively looking for work and can start to work within two weeks. Work is defined as working 4 hours or more in a week. As table 5 indicates, the unemployed within this population has nearly doubled in size from 2018 to 2019. This is a clear indication of dire economic times as people are starting to look for work at a younger age.
